

DBMS PROJECT

On

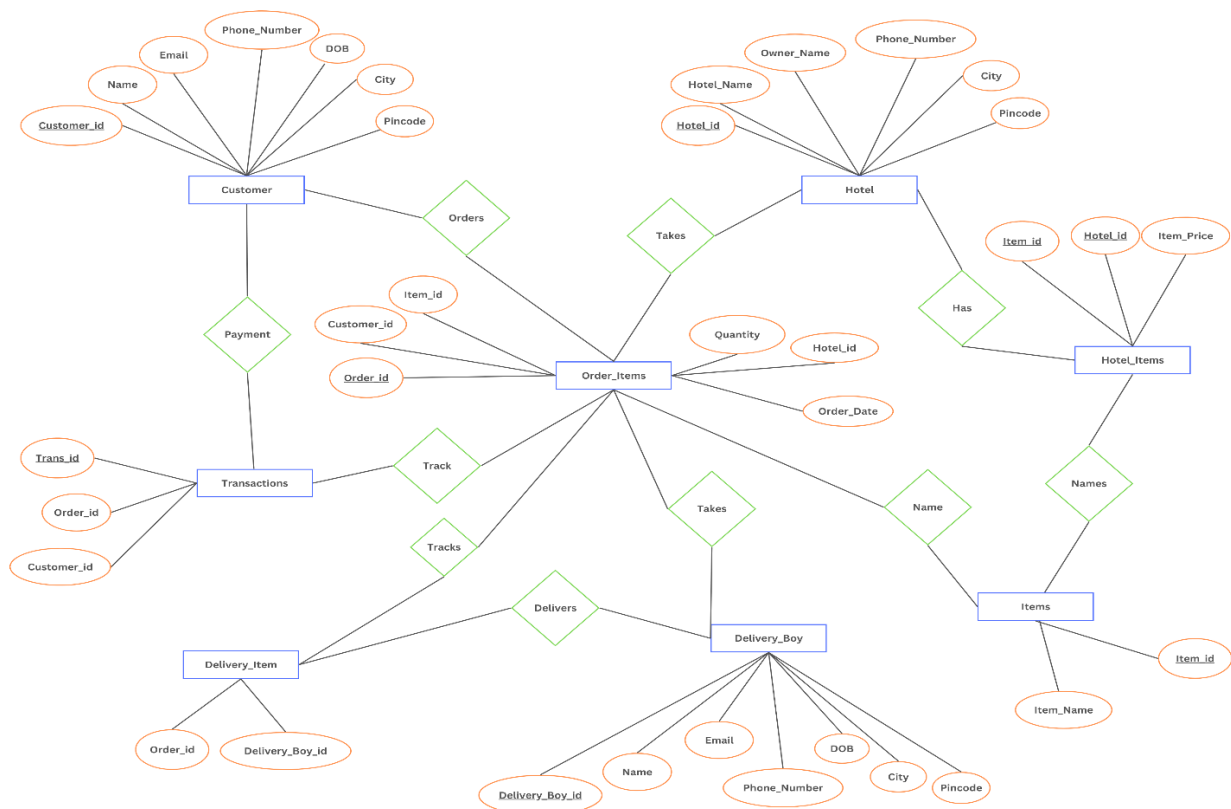

Food Delivery System

Designed by
Neeraj Dattu Dudam (195117)

Problem Statement:

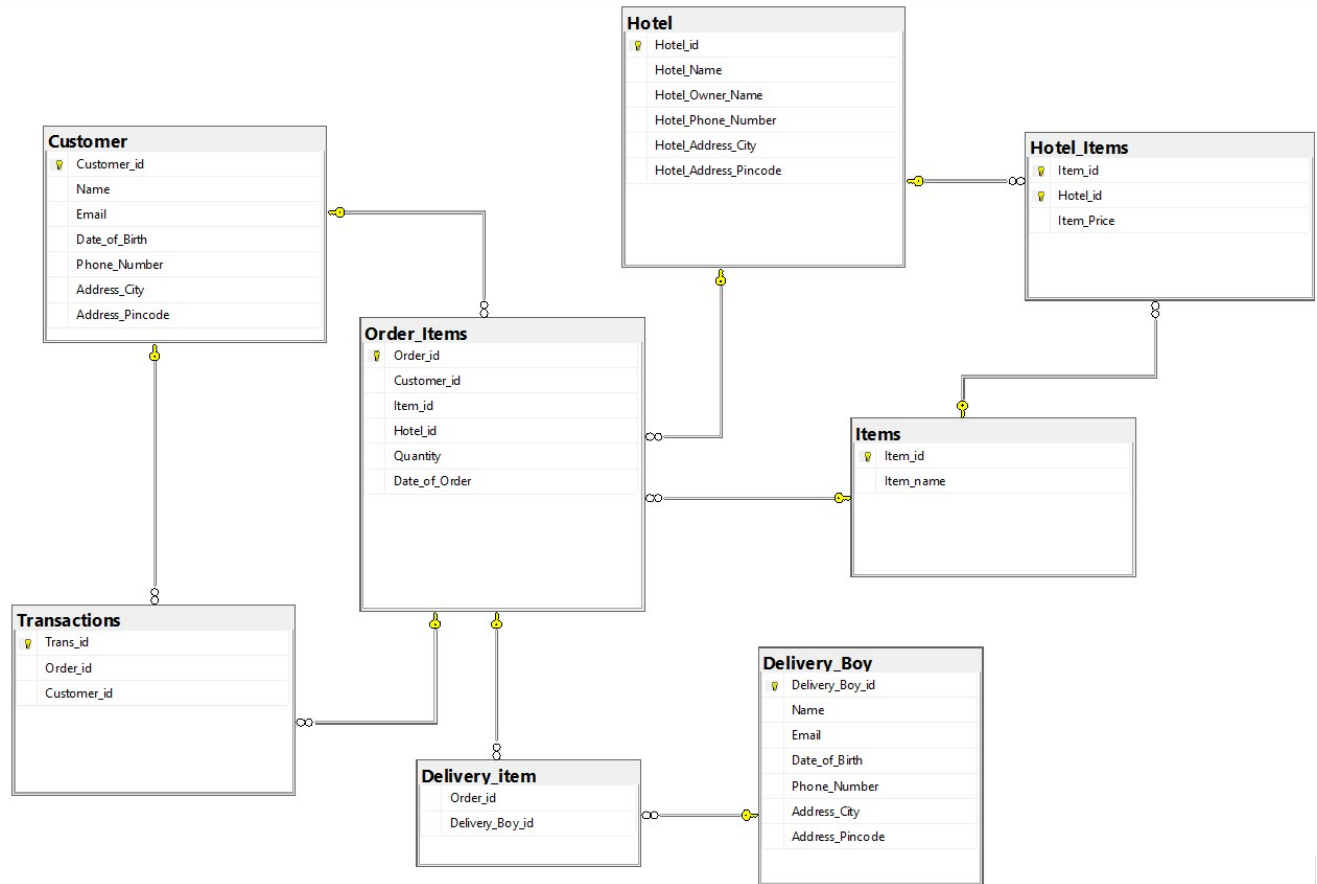

It should provide efficient interface for Food Delivery between Customer, Hotel and Delivery Boy. It should solve frequent customer queries in providing information about the order details like quantity, amount, from the hotel from which the item is ordered, the delivery person who delivered the order, and it should solve queries of the hotel in providing information about the customer and order details. By this system the customer and order their most liked item according to price and hotel and the hotel can analyze their orders.

Entity Relationship Diagram:

Relational Model:

Converted the ER Diagram to relational model using SQL.

Normalisation:

Entity 1: Customer

Attributes:

1. Customer_id
2. Name
3. Email
4. Date_of_Birth

5. City
6. Pincode

Functional Dependencies:

1. Customer_id \rightarrow Name
2. Customer_id \rightarrow Email
3. Customer_id \rightarrow Date_of_Birth
4. Customer_id \rightarrow City
5. Customer_id \rightarrow Pincode

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

*Entity 2: **Hotel***

Attributes:

1. Hotel_id
2. Hotel_Name
3. Hotel_Owner_Name
4. Hotel_Phone_Number
5. Hotel_City
6. Hotel_Pincode

Functional Dependencies:

1. Hotel_id \rightarrow Hotel_Name
2. Hotel_id \rightarrow Hotel_Owner_Name

3. Hotel_id \rightarrow Hotel_Phone_Number
4. Hotel_id \rightarrow Hotel_City
5. Hotel_id \rightarrow Hotel_Pincode

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

Entity 3: Items

Attributes:

1. Item_id
2. Item_Name

Functional Dependencies:

1. Item_id \rightarrow Item_Name

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

Entity 4: Hotel_Items

Attributes:

1. Item_id
2. Hotel_id
3. Item_Price

Functional Dependencies:

1. Item_id, Hotel_id \rightarrow Item_Price

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

*Entity 5: **Delivery_Boy****Attributes:*

1. Delivery_Boy_id
2. Name
3. Email
4. Date_of_Birth
5. Phone_Number
6. City
7. Pincode

Functional Dependencies:

1. Delivery_Boy_id \rightarrow Name
2. Delivery_Boy_id \rightarrow Email
3. Delivery_Boy_id \rightarrow Date_of_Birth
4. Delivery_Boy_id \rightarrow Phone_Number
5. Delivery_Boy_id \rightarrow City
6. Delivery_Boy_id \rightarrow Pincode

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

*Entity 6: **Order_Items***

Attributes:

1. Order_id
2. Customer_id
3. Item_id
4. Hotel_id
5. Quantity
6. Date_of_Order

Functional Dependencies:

1. Order_id \rightarrow Customer_id
2. Order_id \rightarrow Item_id
3. Order_id \rightarrow Hotel_id
4. Order_id \rightarrow Quantity
5. Order_id \rightarrow Date_of_Order

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

*Entity 7: **Delivery_Item***

Attributes:

1. Order_id
2. Delivery_Boy_id

Functional Dependencies:

No functional Dependencies.

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and there are non-candidate so it is in 2NF. There is no transitive dependency, so it is in 3NF.

Entity 8: Transactions

Attributes:

1. Trans_id
2. Order_id
3. Customer_id

Functional Dependencies:

1. Trans_id \rightarrow Order_id
2. Trans_id \rightarrow Customer_id

This relation is in 3NF. There is no multivalued attribute, so it is in 1NF, and all the non-candidate keys are depended on primary key, so it is in 2NF. There is no transitive dependency, so it is in 3NF.

Creating Tables:

1. Customer

```
create table Customer (  
    Customer_id int not null identity (1,1) primary key,  
    Name varchar(30) not null,  
    Email varchar(30) not null,  
    Date_of_Birth date not null,  
    Phone_Number bigint not null,  
    Address_City varchar(30) not null,  
    Address_Pincode int not null  
);
```

2. Hotel

```
create table Hotel (  
    Hotel_id int not null identity (1,1) primary key ,  
    Hotel_Name varchar(30) not null,  
    Hotel_Owner_Name varchar(30) not null,  
    Hotel_Phone_Number bigint not null,  
    Hotel_Address_City varchar(30) not null,  
    Hotel_Address_Pincode int not null  
);
```

3. Items

```
create table Items(  
    Item_id int not null identity (1,1) primary key,  
    Item_name varchar(30) not null  
);
```

4. Hotel_Items

```
create table Hotel_Items (  
    Item_id int not null foreign key references  
    Items(Item_id),  
    Hotel_id int not null foreign key references  
    Hotel(Hotel_id),
```

```
    Item_Price int not null,  
    primary key (Item_id, Hotel_id)  
);
```

5. Delivery_Boy

```
create table Delivery_Boy (  
    Delivery_Boy_id int not null primary key,  
    Name varchar(30) not null,  
    Email varchar(30) not null,  
    Date_of_Birth date not null,  
    Phone_Number bigint not null,  
    Address_City varchar(30) not null,  
    Address_Pincode int not null  
);
```

6. Order_Items

```
create table Order_Items (  
    Order_id int not null identity (1,1) primary key,  
    Customer_id int not null foreign key references  
    Customer(Customer_id),  
    Item_id int not null foreign key references  
    Items(Item_id),  
    Hotel_id int not null foreign key references  
    Hotel(Hotel_id),  
    Quantity int not null,  
    Date_of_Order date not null,  
);
```

7. Delivery_Item

```
create table Delivery_item (  
    Order_id int not null foreign key references  
    Order_Items(Order_id),  
    Delivery_Boy_id int not null foreign key references  
    Delivery_Boy(Delivery_Boy_id)  
)
```

8. Transaction

```
create table Transactions (
    Trans_id int not null identity (1,1) primary key,
    Order_id int not null foreign key references
    Order_Items(Order_id),
    Customer_id int not null foreign key references
    Customer(Customer_id),
);
```

Inserting data into Tables:

1. Customer

```
Insert into Customer Values

(31, 31, 21),
(32, 32, 20),
(33, 33, 22);

Executing Queries:

Query 1:

The following query retrieves data from database by doing INNER JOIN and displays Hotel_Name, Item_Price, Item_Name joining three tables Hotel, Hotel_Items, Items.

```
SELECT Hotel_Name, Item_Price, Item_Name FROM Items i
INNER JOIN Hotel_Items hi ON hi.Item_id = i.Item_id
INNER JOIN Hotel h ON hi.Hotel_id = h.Hotel_id ORDER BY
Item_Name
```

The screenshot shows a database query execution interface. The query is as follows:

```
SELECT
Hotel_Name, Item_Price, Item_Name
FROM
Items i INNER JOIN Hotel_Items hi
ON hi.Item_id = i.Item_id INNER JOIN Hotel h ON hi.Hotel_id = h.Hotel_id
ORDER BY Item_Name
```

The results are displayed in a table with 3 columns: Hotel_Name, Item_Price, and Item_Name. The table contains 31 rows of data, sorted by Item_Name.

	Hotel_Name	Item_Price	Item_Name
1	Raghu Mess	70	Aloo Rice
2	Shiva Veg Mess	50	Aloo Rice
3	Maa vanta Gadhi Mess	90	Aloo Rice
4	Suprabath Hotel of Meals	80	Aloo Rice
5	Randi Babu Randi Mess	50	Aloo Rice
6	World Famous Mess	80	Aloo Rice
7	Surya Meals and Tiffins	30	Dosa
8	Star Tiffins	30	Dosa
9	Tini po Bro Tiffins	35	Dosa

Query 2:

The following query retrieves data from database by doing INNER JOIN and done a multiply operation to display amount and displays Date_of_Order, Customer_Name, Item_Name, Quantity, Amount joining four tables Order_Items, Customer, Items, Hotel_Items.

```
SELECT Date_of_Order, Name, Item_Name, Quantity,
Hotel_Name, (Quantity * Item_Price) AS Amount FROM
Order_Items oi INNER JOIN Customer c ON oi.Customer_id =
c.Customer_id INNER JOIN Items i on oi.Item_id =
i.Item_id INNER JOIN Hotel_Items hi ON oi.Item_id =
hi.Item_id AND oi.Hotel_id = hi.Hotel_id INNER JOIN
Hotel hn ON oi.Hotel_id = hn.Hotel_id
```

SELECT
Date_of_Order, Name, Item_Name, Quantity, Hotel_Name, (Quantity * Item_Price) AS Amount
FROM
Order_Items oi INNER JOIN Customer c ON oi.Customer_id = c.Customer_id
INNER JOIN Items i on oi.Item_id = i.Item_id
INNER JOIN Hotel_Items hi ON oi.Item_id = hi.Item_id AND oi.Hotel_id = hi.Hotel_id
INNER JOIN Hotel hn ON oi.Hotel_id = hn.Hotel_id
